liquidity

word count per 1000

NBFIs, esp. investment funds

- exposure to USD, partly hedged
- decreased levels of (HQLA level 1) liquidity
- exposure to EA corporate debt strongly affected by trade tensions

NFCs, esp. manufacturing

- several sectors already under pressure, mainly due to elevated interest rates, stagnant growth and regulation.
- manufacturing hit also by higher energy prices and tariffs, high import and export reliance
- signs of worsening credit quality: debt service costs and bankruptcies.

Geopolitical risk

Sovereign risk

Sovereign debt

€NB

- sovereign debt reaches levels of post ww2.
- "governments addicted to debt" **Financial Times**,
2025-03-27

Euro Area:

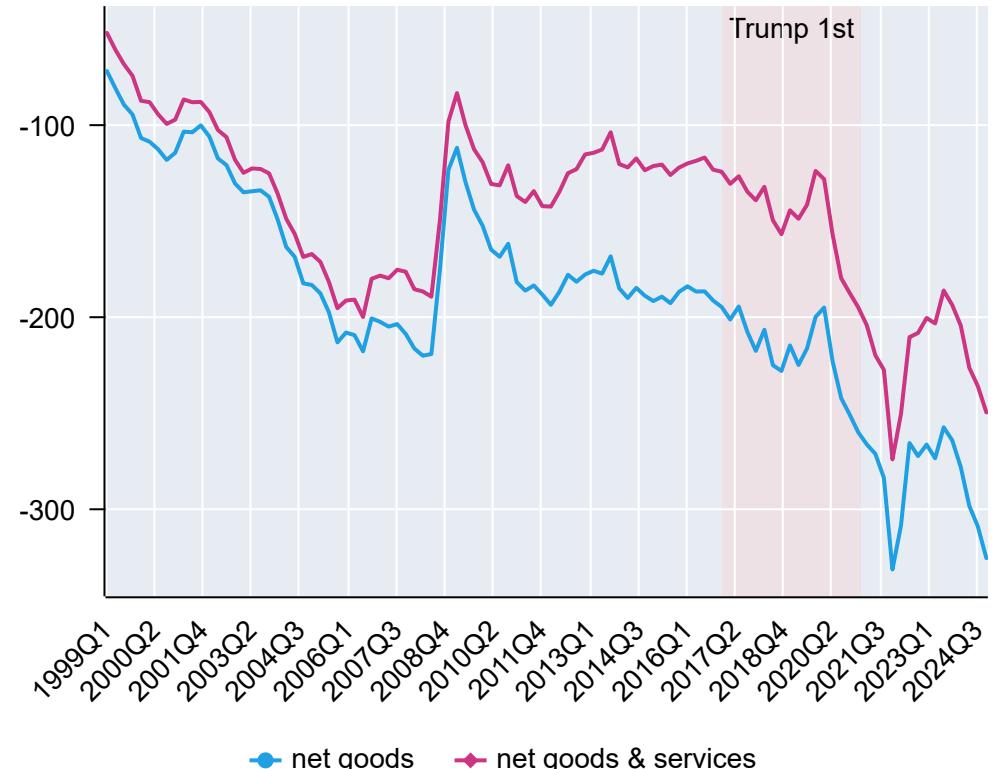

- low growth
- high tax burden
- deficit 3%

US:

- even lower fiscal discipline
- strongly externally funded, chronic twin deficit
- growth at risk

deficits despite peacetime, absence of pandemic and record low unemployment (**6.2% Euro Area** and **4.2% US**)

Why could it happen?

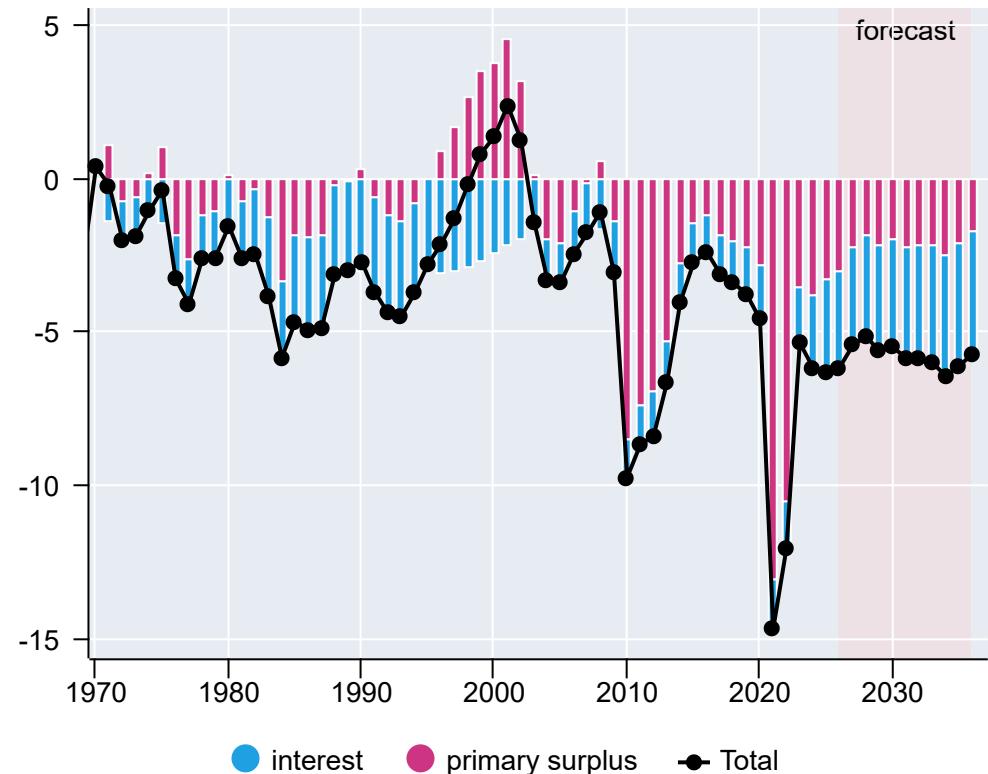

- **Mar-a-Lago Accord** : "term-out of reserve debt", "impose a user fee on foreign official holders of Treasury securities, for instance withholding a portion of interest payments on those holdings".
- make away past trade deficits.
- pressure from budget deficit, interest payments, deficit in primary income.
- yields incentivize fiscal discipline but also debt "renegotiation" if foreigners bear brunt.
- word magic.

Why it is unlikely?

- impossibility of clean separation.
- trust cannot be switched on/off as tariffs can.
- rationality gained influence, markets have influence.
